

Applied Deep Learning

BERT Variants

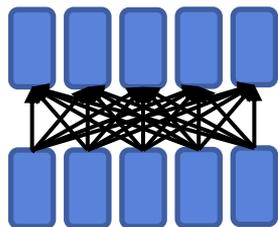

September 18th, 2024

<http://adl.miulab.tw>

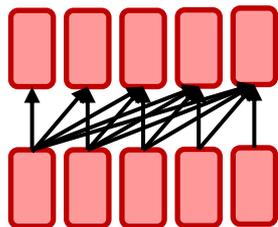

National
Taiwan
University
國立臺灣大學

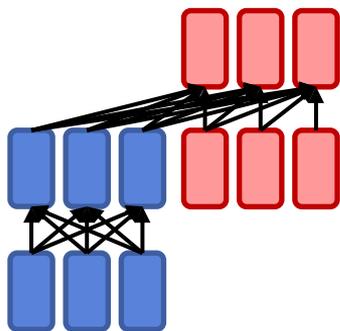

Three Types of Model Pre-Training

- Encoder
 - Bidirectional context
 - Examples: BERT and its variants

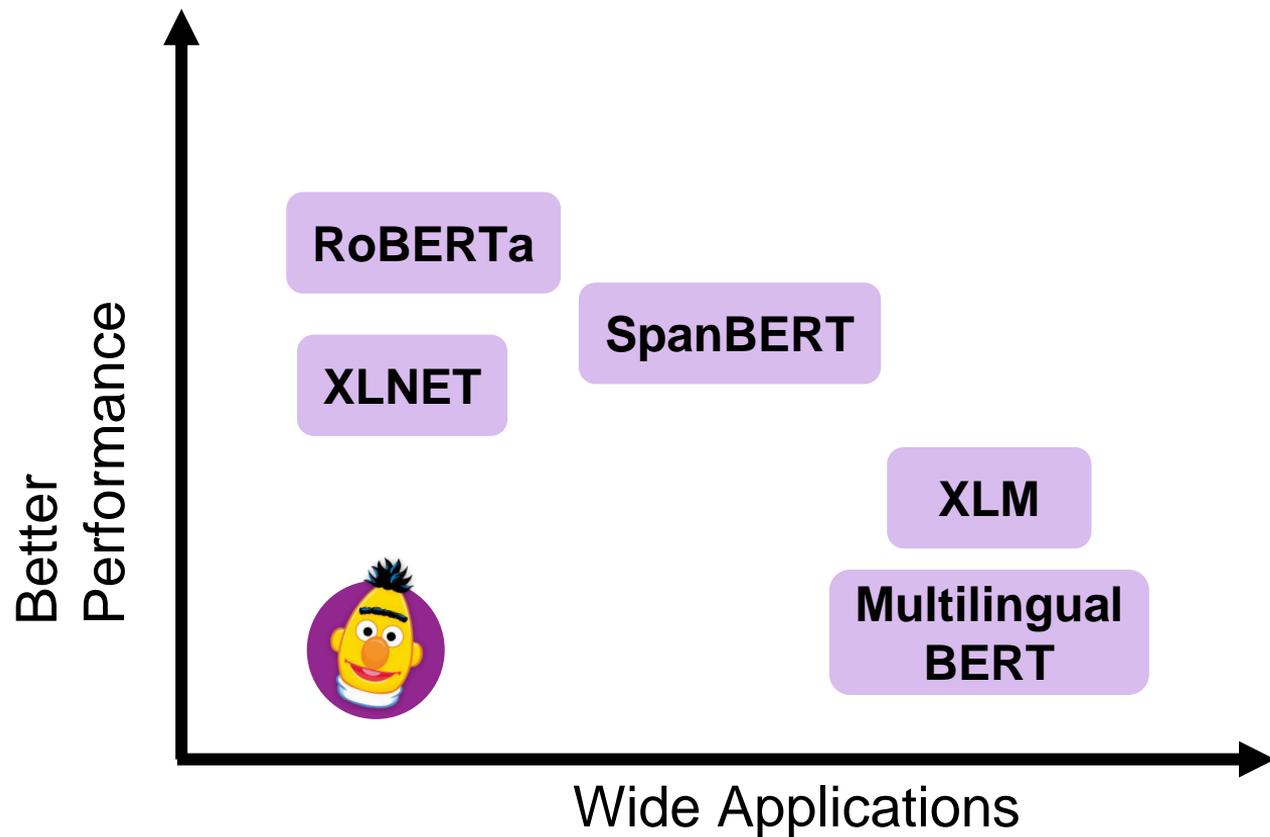

- Decoder
 - Language modeling; better for generation

- Encoder-Decoder
 - Sequence-to-sequence model

Beyond BERT

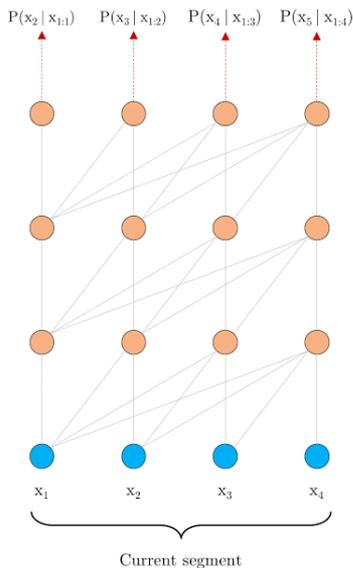

4

Transformer-XL

(Dai et al, 2019)

Issue: context fragmentation

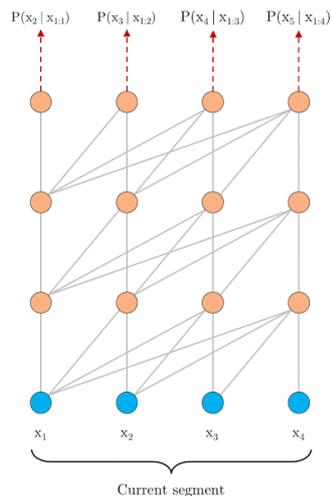

- Long dependency: unable to model dependencies longer than a fixed length
- Inefficient optimization: ignore sentence boundaries

6 Transformer-XL (extra-long)

○ Idea: segment-level recurrence

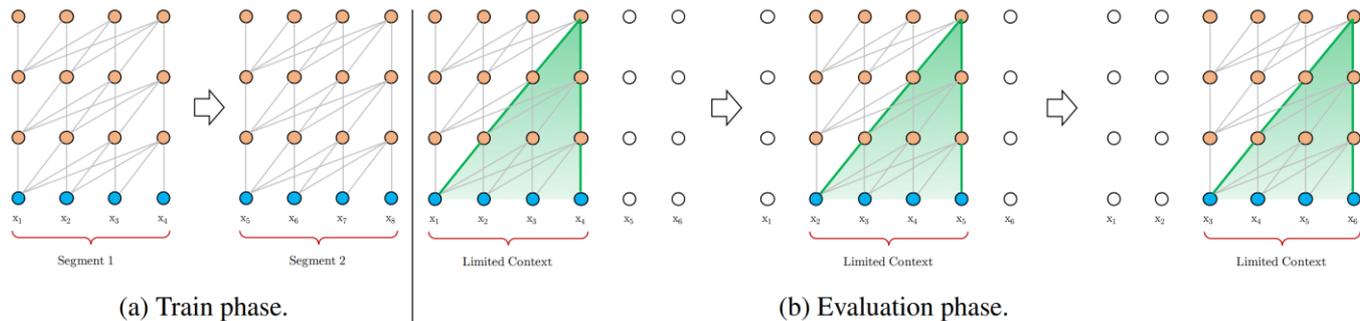

- Previous segment embeddings are **fixed** and **cached** to be reused when training the next segment
- → increases the largest dependency length by N times (N: network depth)

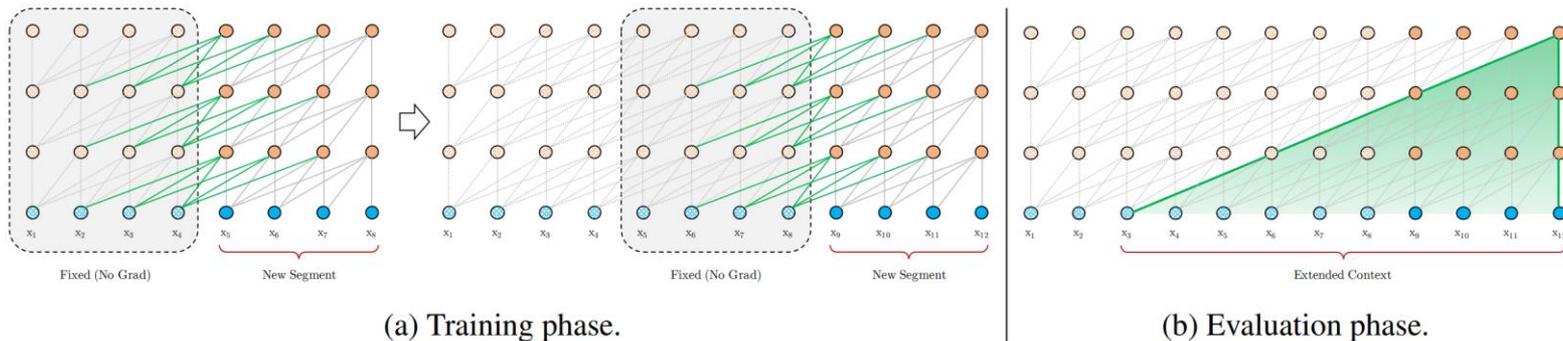

resolve the context fragmentation issue and makes the dependency longer

State Reuse for Segment-Level Recurrence

Vanilla

State Reuse

Positional Encoding

- Issue: naively applying segment-level recurrence can't work
 - absolute positional encodings are *incoherent* when reusing

$[0, 1, 2, 3] \rightarrow [0, 1, 2, 3, 0, 1, 2, 3]$

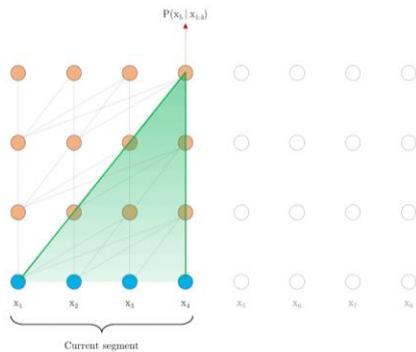

relative positional encoding for supporting state reuse

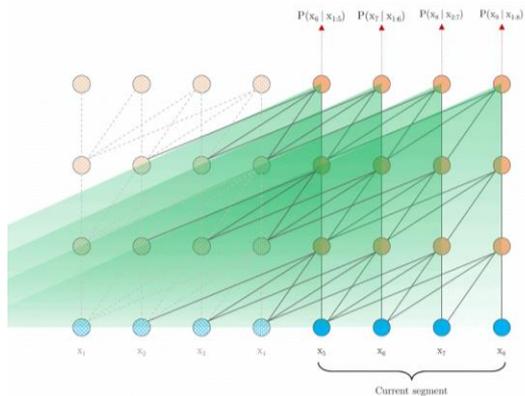

learnable positional embeddings

Segment-Level Recurrence in Inference

Vanilla

State Reuse

Contributions

- ⦿ Longer context dependency
 - Learn dependency than vanilla Transformers
 - Better perplexity on long sequences
 - Better perplexity on short sequences by addressing the fragmentation issue
- ⦿ Speed increase
 - Process new segments without recomputation
 - Achieve up to 1,800+ times faster than a vanilla Transformer during evaluation on LM tasks

11

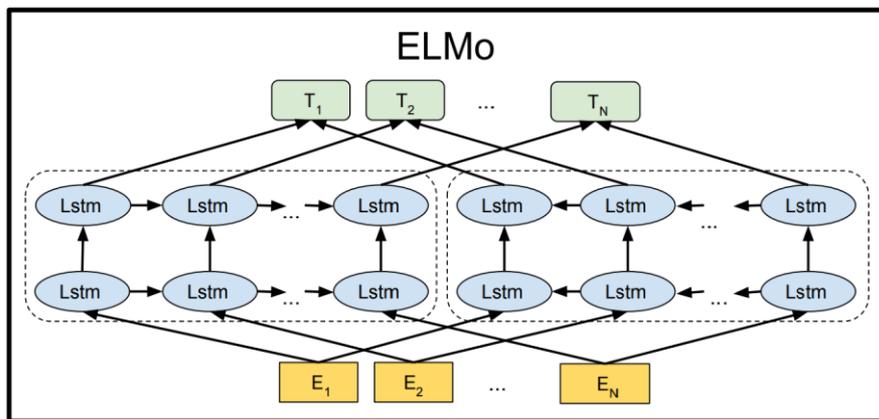

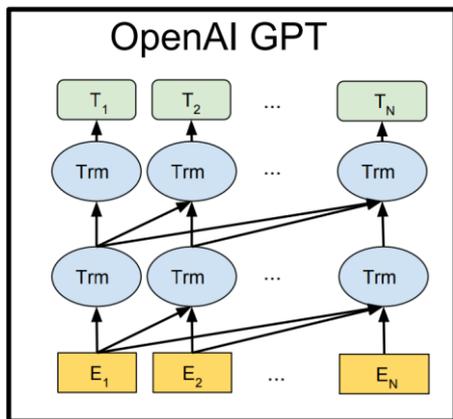

XLNet

(Yang et al., 2019)

Auto-Regressive (AR)

- Objective: modeling information based on either previous or following contexts

$$\max_{\theta} \log p_{\theta}(\mathbf{x}) = \sum_{t=1}^T \log p_{\theta}(x_t | \mathbf{x}_{<t}) = \sum_{t=1}^T \log \frac{\exp(h_{\theta}(\mathbf{x}_{1:t-1})^{\top} e(x_t))}{\sum_{x'} \exp(h_{\theta}(\mathbf{x}_{1:t-1})^{\top} e(x'))}$$

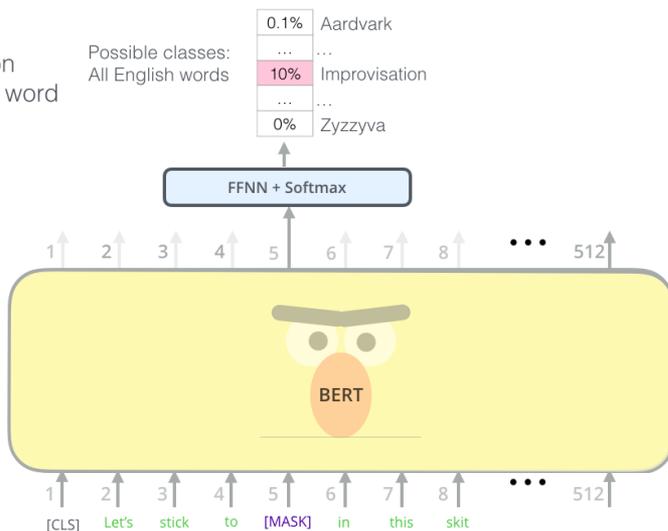

Auto-Encoding (AE)

- Objective: reconstructing \bar{x} from \hat{x}

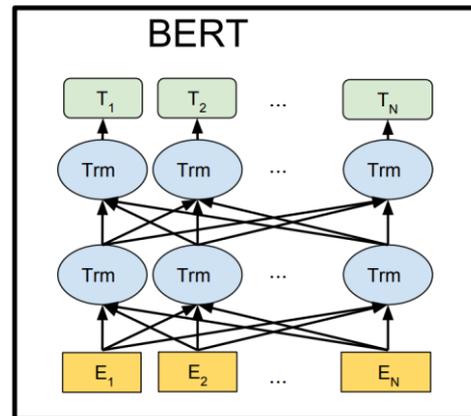

$$\max_{\theta} \log p_{\theta}(\bar{x} | \hat{x}) \approx \sum_{t=1}^T m_t \log p_{\theta}(x_t | \hat{x}) = \sum_{t=1}^T m_t \log \frac{\exp(H_{\theta}(\hat{x})_t^{\top} e(x_t))}{\sum_{x'} \exp(H_{\theta}(\hat{x})_t^{\top} e(x'))}$$

- dimension reduction or denoising (masked LM)

Use the output of the masked word's position to predict the masked word

Randomly mask
15% of tokens

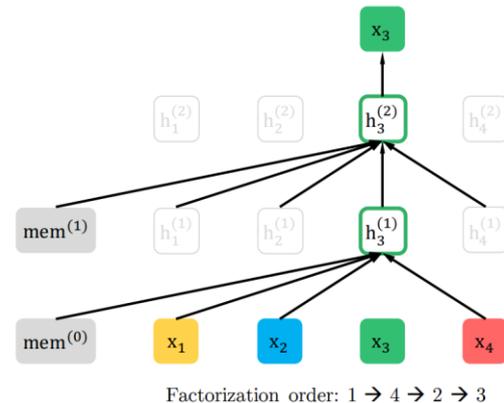

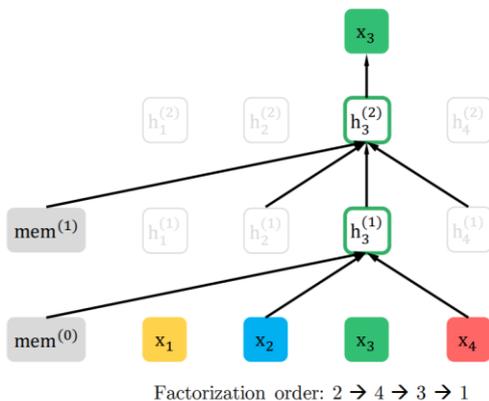

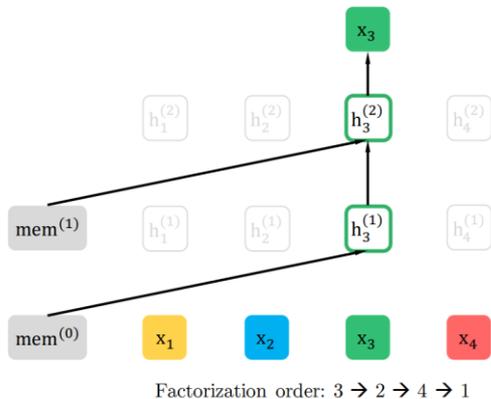

Auto-Encoding (AE)

Issues

- *Independence assumption*: ignore the dependency between masks
- *Input noise*: discrepancy between pre-training and fine-tuning
(w/ [MASK]) (w/o [MASK])

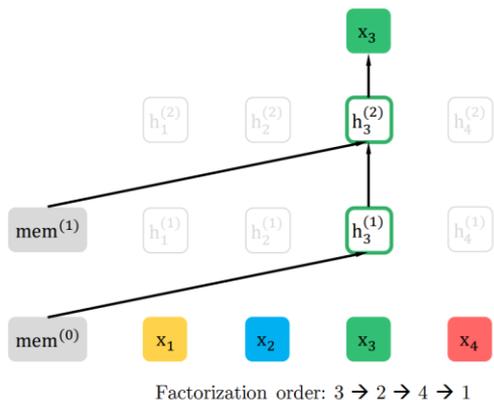

Permutation Language Model

- Goal: use AR and bidirectional contexts for prediction
- Idea: parameters shared across all factorization orders in expectation
 - $T!$ different orders to a valid AR factorization for a sequence of length T
 - Pre-training on sequences sampled from all possible permutations

Permutation Language Model

- Implementation: only permute the factorization order
 - Remain original positional encoding
 - Rely on proper attention masks in Transformers

	x_1	x_4	x_2	x_3
x_1	●			
x_4	●	●		
x_2	●	●	●	
x_3	●	●	●	●

	x_1	x_2	x_3	x_4
x_1	●			
x_2	●	●		●
x_3	●	●	●	●
x_4	●			●

resolve independence assumption and pretrain-finetune discrepancy issues

Two-Stream Self-Attention

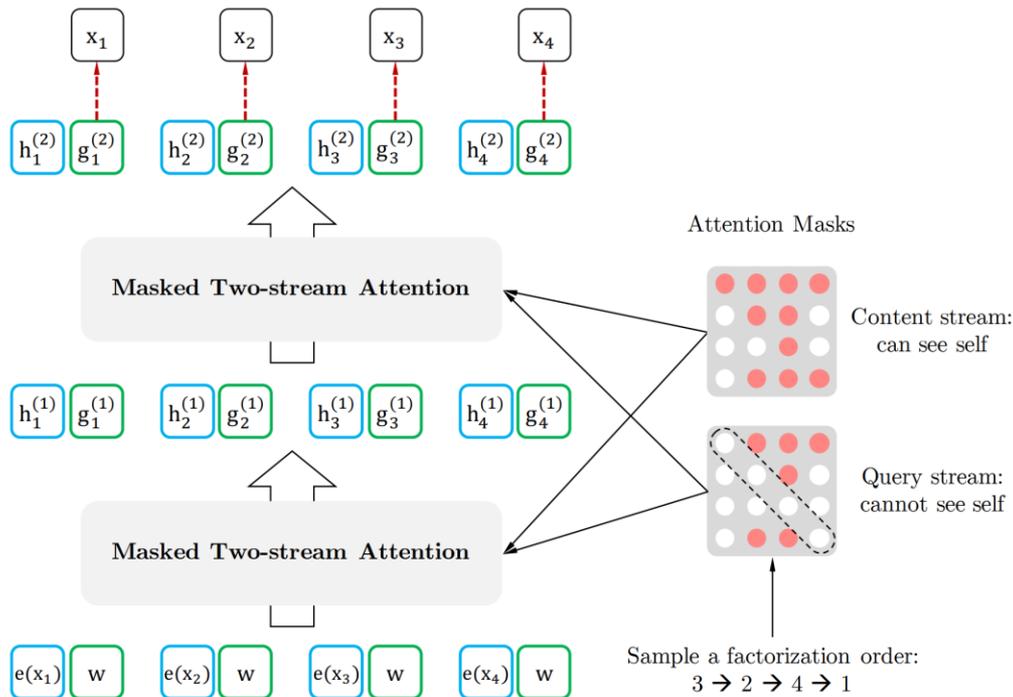

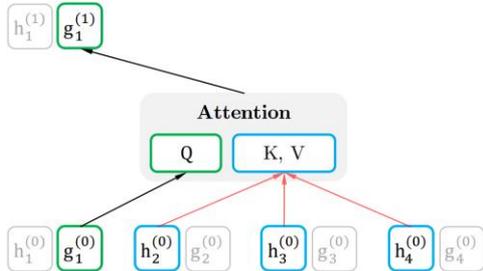

Content stream

- Predict other tokens

Query stream

- Predict the current token

GLUE Results

Model	MNLI	QNLI	QQP	RTE	SST-2	MRPC	CoLA	STS-B	WNLI
<i>Single-task single models on dev</i>

XLNet*	90.2/89.7[†]	98.6[†]	90.3 [†]	86.3	96.8[†]	93.0	67.8	91.6	90.4

Contributions

- AR for addressing independence assumption

$$\mathcal{J}_{\text{BERT}} = \log p(\text{New} \mid \text{is a city}) + \log p(\text{York} \mid \text{is a city})$$

$$\mathcal{J}_{\text{XLNet}} = \log p(\text{New} \mid \text{is a city}) + \log p(\text{York} \mid \text{New, is a city})$$

- AE for addressing the pretrain-finetune discrepancy

$$\mathcal{J}_{\text{BERT}} = \sum_{x \in \mathcal{T}} \log p(x \mid \mathcal{N}); \quad \mathcal{J}_{\text{XLNet}} = \sum_{x \in \mathcal{T}} \log p(x \mid \mathcal{N} \cup \mathcal{T}_{<x})$$

20

RoBERTa (Liu et al., 2019)

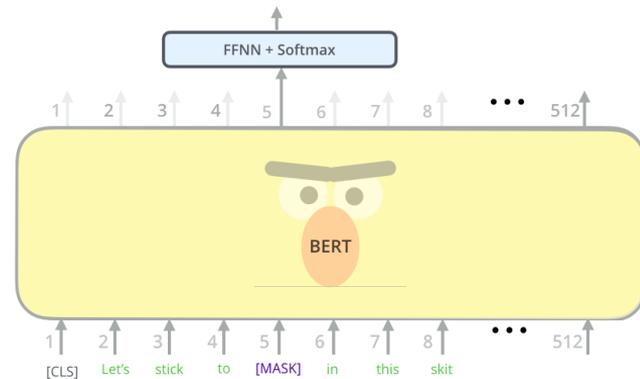

Robustly optimized BERT approach

What's More in RoBERTa

Dynamic masking

- 10 different masking ways over 40 epochs
 - BERT: static masking by preprocessing

Masking	SQuAD 2.0	MNLI-m	SST-2
static	78.3	84.3	92.5
dynamic	78.7	84.0	92.9

Optimization

- peak learning-rate & #warmup-steps tuned separately
- large batch (batch size=8K)

batch size	learning rate	epochs	steps	perplexity	MNLI-m	SST-2
256	1e-4	32	1M	3.99	84.7	92.5
2K	7e-4	32	125K	3.68	85.2	93.1
		64	250K	3.59	85.3	94.1
		128	500K	3.51	85.4	93.5
8K	1e-3	32	31K	3.77	84.4	93.2
		64	63K	3.60	85.3	93.5
		128	125K	3.50	85.8	94.1

What's More in RoBERTa

Data

- train only with full-length sequences
 - BERT: on the reduced length
- BookCorpus + English Wikipedia (16G), CC-News (76G), OpenWebText (38G), Stories (31G)

Model	data	batch size	steps	SQuAD (v1.1/2.0)	MNLI-m	SST-2

24

SpanBERT

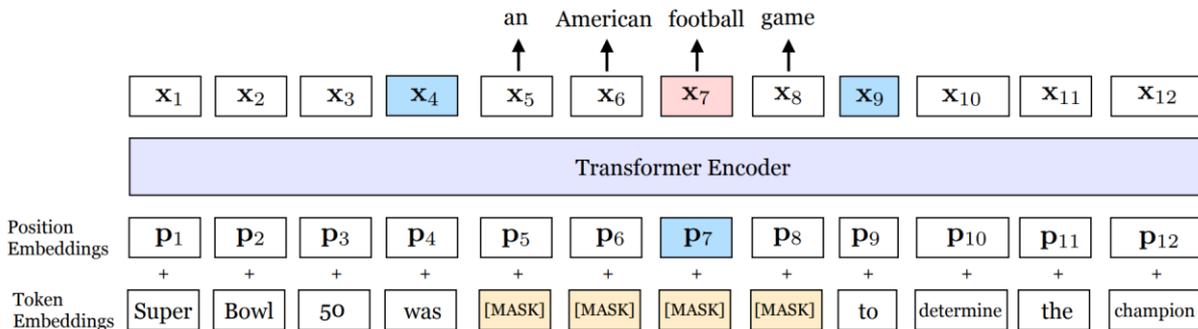

(Joshi et al., 2019)

SpanBERT

- Span masking
 - A random process to mask spans of tokens
- Single sentence training
 - a single contiguous segment of text for each training sample (instead of two)
- Span boundary objective (SBO)
 - predict the entire masked span using only the span's boundary

$$\mathcal{L}(\text{football}) = \mathcal{L}_{\text{MLM}}(\mathbf{x}_7) + \mathcal{L}_{\text{SBO}}(\mathbf{x}_4, \mathbf{x}_9, \mathbf{p}_7)$$

Results

Masking scheme

	SQuAD 2.0	NewsQA	TriviaQA	Coreference	MNLI-m	QNLI
Subword Tokens	83.8	72.0	76.3	77.7	86.7	92.5
Whole Words	84.3	72.8	77.1	76.6	86.3	92.8
Named Entities	84.8	72.7	78.7	75.6	86.0	93.1
Noun Phrases	85.0	73.0	77.7	76.7	86.5	93.2

Concluding Remarks

- Transformer-XL (<https://github.com/kimiyoung/transformer-xl>)
 - Longer context dependency
- XLNet (<https://github.com/zihangdai/xlnet>)
 - AR + AE
 - No pretrain-finetune discrepancy
- RoBERTa (<http://github.com/pytorch/fairseq>)
 - Optimization details & data
- SpanBERT
 - Better for QA, NLI, coreference
- Multilingual BERT (<https://github.com/google-research/bert>)
- XLM (<https://github.com/facebookresearch/XLM>)
 - Zero-shot scenarios
